

Senior Assessment Task

Build a .NET 8 API with one endpoint **POST /api/login** that:

- Accepts a login request (**username**, **ip**, **userAgent**, **succeeded**).
- Saves the request to Redis (cache).
- Publishes the event to Kafka or RabbitMQ (choose either one).
- Saves the data into MSSQL or MongoDB (choose either one).
- Inserts a LoginLog.
- Returns a correlationId (GUID) to the client.

Requirements

- The API must not write directly to the database — only consumers should save data.
- Ensure idempotency (no duplicates by correlationId).
- Log every step: Received, SavedToRedis, Published, Consumed, Saved.

Deliverables

- Source code (API + 2 consumers).
- Result screenshots.
- Logs of all steps, with screenshots.
